Presentation at PACS symposium Seoul, 27-28 October 2016

Robot Intelligence vs. Biological Intelligence?

A discussion based on Physics, Chemistry, Biology, Mathematics, Mind-Science and Philosophy

This was an invited talk at the International Symposium on Perception, Action, and Cognitive Systems (PACS) held in Seoul, Korea, Oct. 27-28, 2016. PACS aims to be a common venue for integrated research in cognitive science, brain science, artificial intelligence, robotics, and human-computer interaction and their practical applications.

The full symposium programme is available at

http://www.kiise.or.kr/pacs/2016/lecture_material.htm

including the lecture material for all the speakers.

- **Added June 2016, Updated November 2016**

<http://www.cs.bham.ac.uk/research/projects/cogaff/misc/inf-2016-sloman.html>

Invited lecture Thursday 2nd June 2016, Hebrew University, Jerusalem

What's information? An Answer from Physics, Biology, Mind-Science and Philosophy

"An Informational View of the Evolution of Living Systems")

Unfortunately some names of speakers on the first day are missing, but are available in the schedule: <http://edelstein.huji.ac.il/events/past-events/conferences/2016-2/information-2>

Abstract:

What's information? An Answer from Physics, Biology, Mind-Science and Philosophy

Like most of my talks this emphasises the fact that focusing on information as something to be *transmitted* or *encoded* is a serious error: information is important for living things and in

engineering primarily because it is *used*, e.g. for various types of control. Requirements for acquisition, encoding, storage, transformation, and manipulation are all derived from the need to **use** information, ever since the very simplest biological organisms. One of the implications is that languages used for internal purposes evolved long before languages for communication, but this has largely been ignored by linguists, philosophers, engineers, etc., though it should have been recognised long ago by all who develop computer programs.

<http://www.cs.bham.ac.uk/research/projects/cogaff/misc/schrodinger-life.html>

Erwin Schrödinger on the Chemical Basis of Life

Annotated extracts from his deep, visionary, little book:

Erwin Schrödinger, *What is life?* CUP, Cambridge, 1944.

It seems to me that what Schrödinger tried to do in this book could be described as attempting to characterise key features of the *Fundamental Construction Kit* (FCK) required to support the many types of *Derived Construction Kit* (DCK) required for biological evolution to have produced the many and varied forms of life we now have on our planet, as discussed in

<http://www.cs.bham.ac.uk/research/projects/cogaff/misc/construction-kits.html>

- **Added 22 Jan 2011. Minor edits 6 Apr 2016**

<http://www.cs.bham.ac.uk/research/projects/cogaff/misc/information-difference.html>

Bateson did not define "information" as "a difference that makes a difference"

(And would have been silly if he had done so.)

It is widely believed that the polymath Gregory Bateson defined "information" as "a difference that makes a difference". I think this is a myth, and he did no such thing.

This alleged definition is often quoted with approval by thinkers of different backgrounds, as can be seen by searching for occurrences of the phrase "a difference that makes a difference" in conjunction with "information". Sometimes the definition is attributed to others, presumably because they have quoted or used it. Searching through what he actually wrote, I found that in the 1972, Chandler Paperback edition of *Steps to an Ecology of Mind: Collected Essays in Anthropology*, Bateson described "a bit of information" and later "**the elementary unit of information**" as "a difference that makes a difference".

He does this in at least two of the essays, namely in "The Cybernetics of 'Self': A Theory of Alcoholism" and in "Form Substance and Difference".

etc., etc.

The paper discusses various interpretations and possible justifications for what he wrote and why the standard quotation is seriously misleading.

<http://www.cs.bham.ac.uk/research/projects/cogaff/misc/construction-kits.html>
Provisional revised title (8 Apr 2016):
Construction kits for evolving life
(Including evolved minds and mathematical abilities.)
Previously:
Construction kits for biological evolution
(Including evolution of minds and mathematical abilities.)

The scientific/metaphysical explanatory role of construction kits.

I'll present a partial outline answer to the question: How was it possible for the known and unknown varieties of life to evolve from lifeless matter, including some varieties that are able to make the mathematical discoveries assembled in Euclid's Elements? The answer proposed here is based on construction kits, both fundamental and derived. The fundamental construction kit (FCK) is provided by physics/chemistry. Derived construction kits (DCKs) are produced/discovered and used by natural selection, by individual development and learning, and by cultural changes. This leads to a (possibly) new account of the role of mathematics in biological evolution, including the implicit discovery by natural selection of mathematical theorems and proofs about what is possible. There are also implications for metaphysics, theories of grounding, and alternatives to possible world semantics for concepts of 'possible', 'necessary' and 'contingent'.

A shorter version of this paper will appear in *The Incomputable*
(To be published by Springer)
Eds. Mariya Soskova and the late S Barry Cooper

<http://www.cs.bham.ac.uk/research/projects/cogaff/misc/family-resemblance-vs-polymorphism.html>

Family Resemblance vs. Polymorphism A comparison:

Wittgenstein's Family Resemblance Theory vs.

--- Ryle's Polymorphism and

--- Polymorphism in Computer Science/Mathematics

Philosophers, linguists, and no doubt many others, have been puzzled by the fact that some words that we all use effortlessly in everyday conversation are very difficult to define. Examples include "goodness", "truth", "knowledge", "science", "life", "consciousness", "experience", "belief", "game", "rationality", "normality", "intelligence", "pile", "heap", "big", and many more. Some of them are harder than others, and the causes of difficulty are not all the same.

This discussion paper briefly summarises some of the problems, and some of the solutions that have been presented by philosophers, and then attempts to relate the problems to deep ideas developed in Computer Science since the middle of the 20th century, ideas that appear to have been ignored by most philosophers, especially the concept of "parametric polymorphism". (I think it can be argued that the same concept is used, with different labels, by mathematicians, but will not pursue that now.) I shall also say a little at the end about how the notion of "virtual machine functionalism", which is related to complex and largely unrecognized developments in computer systems engineering, is relevant to some aspects of what we call "consciousness".

Philosophers, linguists, and no doubt many others, have been puzzled by the fact that some words that we all use effortlessly in everyday conversation are very difficult to define. Examples include "goodness", "truth", "knowledge", "science", "life", "consciousness", "experience", "belief", "game", "rationality", "normality", "intelligence", "pile", "heap", "big", and many more. Some of them are harder than others, and the causes of difficulty are not all the same.

Talk at the Bristol Visual Information Laboratory

Friday Oct 2nd, 4pm

Seminar Room, Life Sciences Building

Topic:

Why are the many recent results in statistics-based machine vision misleading?

Perhaps because none of the mechanisms used can account for the roles of vision in mathematical discoveries leading to Euclid's Elements 2.5 millennia ago?

Expanded notes [above](#).

- **Installed 6 March 2013**

<http://www.cs.bham.ac.uk/research/projects/cogaff/misc/two-faces.html>

Do the eyes in the left face and the right face look the same?

Most people say that the eyes in the two faces look different -- not geometrically different, but different in a way that appears to be part of the expression.

I think this provides indirect evidence for part of the architectural theory developed in the CogAff project, in particular the claims about "multi-window perception" contrasted with "peephole perception".

- **Installed 24th December 2015: Challenges for vision researchers**

<http://www.cs.bham.ac.uk/research/projects/cogaff/misc/vision/plants/>

Videos involving plant matter: Garden-process qualia

Or more generally: complex fast-changing qualia

A not very high quality video camera was moved around in a Birmingham garden. Several short video recordings were made, with the same settings, on different days, and not all in the same parts of the garden. The aim is, eventually, to use these and other examples, to help characterise what's missing from current AI/Robotic/psychological/neural research on motion perception, and more generally visual perception.

Challenges for vision researchers: by what criteria should an artificial vision system's ability to 'see' such moving scenes be evaluated? How can what humans see in these videos be compared with what a machine sees?

Most humans cannot produce a 3-D model of what they see and project it onto a variety of viewing planes -- one of the standard tests for an AI 3-D vision system. What would be a better test?

No normal human could produce a detailed verbal description of what is seen in the videos.

(J.L. Austin: "Fact is richer than diction").

<http://www.cs.bham.ac.uk/research/projects/cogaff/misc/folded-paper-theorem.html>

IMPOSSIBLE PAPER FOLDS

This paper is an appendix to the document on perceiving and understanding impossibilities, presenting an autobiographical report on an episode in which two people attempted to perform an impossible task involving papering a ceiling and did not notice that it was impossible until after the first attempt failed. I suspect that similar experiences may have preceded some of the discoveries presented by Euclid.

The paper also reports a mistake in my spatial reasoning that someone else had to correct.
(Compare I. Lakatos *Proofs and Refutations*.)

- **Added 8 Nov 2014; Updated Jan 2016**

<http://www.cs.bham.ac.uk/research/projects/cogaff/misc/entropy-evolution.html>

Tentative non-mathematical thoughts on entropy, evolution and construction-kits

What sort of construction-kit must the physical universe have provided to make it possible for life, mind, ecosystems, cultures, etc. to evolve from a planet formed from a cloud of dust?

Are worries about entropy important?
(What happened to Droguli?)

This document does not defend any theistic form of creationism, though it is about beginnings. More precisely: it addresses the question what must the world be like for life as we know it (including human minds) to be able to emerge in a physical universe without life? I shall attempt to map some of the detailed features common to wide ranges of living things onto requirements for the physical substrate. We can then ask what the physical substrate needed to be like at the birth of this planet (or earlier) in order to make possible evolution of known forms of life, and intelligence. But this is a first draft.

This is a first draft discussion, and will probably be revised in the light of further research and suggestions and criticisms from others more knowledgeable, especially about entropy and physics. (Email comments and suggestions welcome, including links to useful online resources.)

This is closely related to the paper on [Construction kits for biological evolution](#)

- **Added 26 Jan 2016**

<http://www.cs.bham.ac.uk/research/projects/cogaff/misc/quantum-evolution.html>

Quantum Mechanical Construction Kits?

(Possible roles in evolution of minds and mathematical abilities.)

Including a tentative discussion of a possible role for quantum mechanisms for control of perceptual processes:

There may be new things to be said about relationships between quantum mechanics and complex biological control mechanisms and perceptual processes, for example because visual processing requires very rapid coordination of complex and varied forms of information about different structures and processes in the perceiver's physical environment, as well as the perceiver's location and motion in that environment. In some cases, intentions of the user and/or other agents in the environment also need to be taken into account.

Nothing is said here about the arguments of Penrose and others concerning "consciousness" or Goedel's meta-mathematical theorems.

- **Added here 20 Oct 2015**

<http://www.cs.bham.ac.uk/research/projects/cogaff/misc/sensorimotor.html>

Sensorimotor vs objective contingencies

Initially written in May 2006, and intermittently updated since then.

I have been trying, with limited success, to get people to understand the importance (for theories of mental processes including learning, perception, reasoning and communication), of a distinction between learning about sensorimotor contingencies (concerned with relations between states, events and processes within an animal or machine, also referred to below as 'somatic') and learning about objective condition-consequence contingencies (concerned with relations between states, events and processes in the environment, also referred to below as 'exosomatic').

The distinction is important for theories of infant development, for the design of robots that act in and learn about their environment, and for philosophical and other theories of embodied cognition. One way in which it is important is that it leads to the question whether, and under what conditions, an individual animal or robot starting only with information about the internal motor and sensor signals can use general learning mechanisms, e.g. self-organising nets, or compression algorithms, to derive, in a reasonable time, e.g. several months or a year or two (rather than evolutionary time scales), an ontology referring to external objects

Evolved construction-kits for building minds

Introduction to the Turing-Inspired Meta-Morphogenesis Project

- **INSTALLED 20 DEC 2015**

<http://www.cs.bham.ac.uk/research/projects/cogaff/misc/concurrency.html>

Concurrency and computation

Being mathematically equivalent to a Turing machine may be important for a computer scientist but not so important for an engineer concerned with reliability.

Extract from:

Aaron Sloman, Beyond Turing Equivalence,

In *Machines and Thought: The Legacy of Alan Turing* (vol I),

Eds. P.J.R. Millican and A. Clark, The Clarendon Press, Oxford, pp. 179--219, 1996,

Originally presented at Turing90 Colloquium, Sussex University, April 1990,

"Even if all processes in intelligent machines are exactly mathematically equivalent to Turing computations, it remains possible that some processes cannot be simulated on a Turing equivalent machine except too slowly for practical use. Even if all can, there may be some important differences. For example, three synchronised machines doing the same task in parallel are mathematically equivalent to one machine, yet the difference in reliability is significant to an engineer."

Biology, geometry, philosophy of mathematics and Kantian robotics?
The case of p-geometry and angle trisection
Aaron Sloman
School of Computer Science, University of Birmingham
Summary:
I shall use the example of angle trisection in what I've called P-geometry (as a tribute to Mary Pardoe, a former student, who gave me the idea) to illustrate a collection of issues relating mathematics, philosophy, psychology, evolution, development, and gaps in current AI, partly arising from serious gaps in the implicit requirements analysis behind much research in AI/Cognitive science/Neuroscience, and the long-term inadequacy of currently fashionable statistical/probabilistic learning mechanisms.

<http://www.cs.bham.ac.uk/research/projects/cogaff/misc/chewing-test.html>

The Chewing Test for Intelligence

I first suggested in my 1978 book that human mouths are more important than generally appreciated for development of intelligence, even from birth, in ways that are relevant to debates about bottle-feeding vs. breast-feeding

I have also repeatedly argued not only that Alan Turing did not propose a behavioural test for intelligence (he was far too intelligent to do that). But various people keep on offering revisions of the supposed Turing Test, and others make the mistake of claiming that intelligence is deeply connected with sensory-motor morphology, ignoring most uses of human intelligence. This semi-serious paper argues that if they believe that they they should base their theories of intelligence on human mouths and their movable contents, and give their robots mouths with movable lips, cheeks, tongue, etc. Some of them might pass the "cherry pie" test allegedly used on competitors for fellowships at All Souls College Oxford. The paper also makes some serious points, e.g. about humans born with serious physical abnormalities, the importance of both online and offline intelligence in animals and machines. And criticises those who use a "passive walker" robot as evidence that intelligence does not require computation, only the right physical design.

Biological/Evolutionary Foundations of Mathematics (BEFM)

The ideas about roles of mathematics in biological evolution, and the role of evolution as contributing to the foundations of mathematics, are presented in this draft paper. This repeats and elaborates some of the ideas in the paper on [Construction Kits](#) above.

Notes for a seminar on

Physical/evolutionary foundations for mathematics vs logico/semantic foundations for mathematics

Notes for an informal seminar in the School of Computer Science,
University of Birmingham Friday 11th September 2016

Expanded in this (Work in Progress document):

<http://www.cs.bham.ac.uk/research/projects/cogaff/misc/what-is-maths.html>

- **Added 23 Nov 2014 (File re-named 15 Dec 2014. Updated 2 Jan 2015, 30 Aug 2015)**

<http://www.cs.bham.ac.uk/research/projects/cogaff/misc/explaining-possibility.html>

Construction kits as explanations of possibilities

(Generators of possibilities)

"How is X possible?" was a question asked for various cases of X by Immanuel Kant (e.g. how is knowledge of synthetic necessary truths possible?). In the early 1970s I wrote a paper, expanding on my 1962 DPhil thesis, that attempted to show that claims about possibility and explanations of possibility are deeply connected with the most fundamental aims of science, and often require the current scientific ontology to be extended. As far as I knew no philosopher of science had addressed such claims and explanations. Moreover they are counter-examples to many philosophical accounts of how scientific theories are, or should be, evaluated. E.g. the claim that X (or something of type X) is possible can never be refuted by experiment or observation. So it was necessary to revise major philosophies of science, including the work of two whom I greatly admired and had learnt from, Karl Popper and Imre Lakatos. Moreover explaining how X is possible seemed to be particularly relevant to some of the newest sciences, including linguistics and artificial intelligence.

After rejection by at least one philosophy of science journal the paper was published in 1976 in *Radical Philosophy*, now online here: <http://www.radicalphilosophy.com/issues/013>

A slightly revised version was published as Chapter 2 of my (messy) 1978 book *The Computer Revolution in Philosophy: Philosophy, science and models of mind* (now freely available online [here](#).) Chapter 2 can be directly accessed [here](#).

To my surprise, several readers told me that they had found that chapter hard to understand, and could not see its relevance to the rest of the book, although a theoretical physicist colleague with a philosophical background, who later went on to receive a Nobel prize for physics, had approved the main ideas. In November 2014, I stumbled across a 1981 review of the 1978 book, by Stephen Stich, which made critical comments about Chapter 2, while approving of much else in the book, though highly critical (and rightly so) of much of the style of presentation. The text of his review is available here (added 19th Nov 2014):

<http://www.cs.bham.ac.uk/research/projects/cogaff/crp/stich-review-crp.html>

A review by Douglas Hofstadter was also unenthusiastic about Chapter 2, while endorsing most of the rest of the book. His review is referenced here:

<http://www.cs.bham.ac.uk/research/projects/cogaff/crp-reviews.html#hofstadter-review>

This document attempts to extend Chapter 2 of CRP by providing a clearer introduction to the idea of a set of possibilities and the concept of an explanation of how something is possible, based on the idea of a construction kit (e.g. Lego, Meccano, plasticine, paper+scissors, a programming language, and many more) as a generator of a set of possibilities.

[A companion piece](#) discusses construction kits required for life and evolution.

A contrasting paper discusses discoveries and explanations of impossibilities: [here](#).

<http://www.cs.bham.ac.uk/research/projects/cogaff/misc/turing-test-2014.html>

Judging Chatbots at Turing Test 2014

Comments following my experience as one of the judges at the "Turing Test" event at the Royal Society in London UK, on 6-7th June 2014:

The claim that the test had at last been passed (even though Turing proposed no test for intelligence) seems to have produced a world wide furore, and much controversy. Turing did not propose a behavioural test for intelligence, any more than he proposed a behavioural test for computation. Both are misguided ideas. What we need is not a **test** but a **theory** about varieties of intelligence, how they evolved, how they develop in individuals, what mechanisms they require, what costs and benefits they bring to organisms, and what developmental trajectories they support and build on.

[Skype interview with Adam Ford](#)

(in Melbourne, Australia) on 12th June 2014 (2am UK time!)

- **[Analysis of limitations of 'black box' tests](#)**

Showing futility of attempts to improve on the Turing Test by requiring richer interaction or more stringent conditions.

Proponents of behavioural tests for information processing power are often unaware of serious

the flaws in such tests. Instead of such tests we need deep explanatory theories capable of explaining not just one individual, but whole species or even larger classes of behaving individuals.

- [Biology, Mathematics, Philosophy, and Evolution of Information Processing](#)
(Added: 12 May 2013. Modified: on or after 24 Sep 2013)
Ian Hacking recently reminded me that Wittgenstein wrote, in
Remarks on the Foundations of Mathematics (1978: VII '33, p. 399)
"For mathematics is after all an anthropological phenomenon."

I think that's a step in the right direction, but the step is much too short. I'll offer an alternative idea as background to the discussion of geometrical and other forms of mathematical and proto-mathematical reasoning capabilities in other documents.

Human mathematics is rooted in **biological** phenomena, concerned with a huge variety of different "domains" and grown in stages, initially mainly by natural selection, then later repeatedly extended through processes of learning, development, and social/cultural change, possibly with further evolutionary development -- all used to address increasingly complex challenges and opportunities presented by the physical world and its occupants, living and non-living, along with new challenges and opportunities continually presented by results of earlier evolutionary developments that have provided new sensors, new manipulators, new information-processing capabilities, new problems of learning and control, and new forms of mathematics implicit in the information-processing strategies.

Neither the domains nor the detailed mathematical facts about the domains are created by evolution or by humans who discover and use them, though evolution creates many new instances of increasingly complex mathematical domains, as do humans and some other animals -- e.g. spiders building webs that conform to certain species specific patterns. But creating instances, need not involve understanding.

Why Asimov's three laws of robotics are unethical
- [embodiment-issues.html](http://www.cs.bham.ac.uk/research/projects/cogaff/misc/freewill.disposed.of)
Computation and Embodiment: Three issues, not two.
Some notes on good and bad reasons for thinking embodiment is relevant to intelligence (or human-like intelligence).
- Discussions of supposed problems of "Free Will"
 - <http://www.cs.bham.ac.uk/research/projects/cogaff/misc/freewill.disposed.of>
Four Concepts of Freewill: Two of them incoherent
 - <http://www.cs.bham.ac.uk/research/projects/cogaff/misc/freewill.disposed.of>
HOW TO DISPOSE OF THE FREE WILL ISSUE
(Originally posted on Usenet in 1989. Later published in AISB Quarterly)
In the framework of analysis of different sets of requirements for animals and robots, and different possible designs of varying complexity, the pre-theoretical concept of freedom of the will needs to be abandoned and replaced with a host of different technical concepts corresponding to the capabilities enabled by different designs.
- <http://www.cs.bham.ac.uk/research/projects/cogaff/misc/logical-geography.html>
Two Notions Contrasted: 'Logical Geography' and 'Logical Topography'
Variations on a theme by Gilbert Ryle:
The logical topography of 'Logical Geography'.

A First Draft Analysis of Some Meta-Requirements for Cognitive Systems in Robots. (An exercise in logical topography analysis.)
- <http://www.cs.bham.ac.uk/research/projects/cogaff/misc/actual.possibilities.html>
ACTUAL POSSIBILITIES (PAPER FROM KR'96)
We (well, some significant subset of humanity, probably including you!) have an intuitive grasp of a family of related concepts of "possibility", "causation" and "constraint" which we often use in thinking about complex mechanisms, and perhaps also in perceptual processes, which according to Gibson are primarily concerned with detecting positive and negative affordances, such as support, obstruction, graspability, etc.

The Future of Computer Science
(Peering into the murk -- via my googol ball.)
- <http://www.cs.bham.ac.uk/research/projects/cogaff/misc/cs-research.html>
TYPES OF RESEARCH IN COMPUTING SCIENCE
SOFTWARE ENGINEERING AND ARTIFICIAL INTELLIGENCE
The Five Categories of Research distinguished (2001, later modified).
 1. *The study of what is possible -- and its scope and limits*
Including both mathematical and less formal modes of theorising.
 2. *The study of existing (naturally occurring) information-processing systems*
E.g. animals, societies, brains, minds,
Sometimes described as "Natural computation".
 3. *Research involving creation of new useful information-processing systems*
I.e. research directly related to engineering applications.
 4. *The creation and evaluation of tools, formalisms and techniques to support all these activities.*
 5. *Research on social and economic issues*
Including studies of the social and economic impact of computing and AI, ethical issues, changing views of humanity, etc.
- [defining-cognition.html](#)
Answer to circulated question on how to define "cognition". Answer: from the design standpoint -- the question is misguided.
(Also on the [euCognition](#) web site)
- **QUESTIONS ABOUT EMOTIONS**
<http://www.cs.bham.ac.uk/research/projects/cogaff/misc/emotions-questions.html>
In December 2005 I was invited by a well known researcher on emotions, Carrol Izard, to contribute to a discussion by answering a few questions as briefly as possible. He asked for 'one-liners', but I was not able to comply with that condition. However, the answers were short for me!
Having taken the trouble to provide him with answers I thought I might as well put them here, in case anyone is interested.

Compare this reply to Deb Roy in 2002. He asked Finally, you said that you "make sharp distinctions between desires, attitudes, moods and emotions". Can you send me a pointer to your most relevant papers on this point? My reply was this document:
<http://www.cs.bham.ac.uk/research/projects/cogaff/misc/emotions-moods-attitudes.txt>
- <http://www.cs.bham.ac.uk/research/projects/cogaff/misc/forms-of-representation.html>
What is a Form of Representation?
(Stub, to be expanded, regarding the different ways information can be encoded so as to be of

practical use to someone or something.)

- <http://www.cs.bham.ac.uk/research/projects/cogaff/misc/evo-prob.html>
Some thoughts about evolution and probabilities
- <http://www.cs.bham.ac.uk/research/projects/cogaff/misc/hawkins-numenta.html>
RESPONSE TO QUESTIONS ABOUT JEFF HAWKINS
